Batch: A-4 Roll No.: 16010122151

Experiment / Assignment / Tutorial No: 7

TITLE : Designing B2C application's interface

AIM : To design B2C application's interface.

Expected OUTCOME of Experiment:

CO 4: Refinement, Prototyping, Implementation of product/ service.

Books/ Journals/ Websites referred:

1 "Design Thinking", Gavin Ambrose Design Paul Harris

Theory:

- The design process engages a high degree of creativity but in a way that is controlled and directed by the process so that it is channeled towards producing a viable, practical solution to the design problem, meeting or excelling the stated aims of the brief.
- While creativity in design is important, design is an activity that serves economic as well as creative goals.
- Within the design process, seven steps can be identified:
 - Define
 - Research
 - Ideate
 - Prototype
 - Select
 - Implement
 - And learn
- First, the design problem and the target audience needs to be defined.
- The research stage reviews information such as the history of the design problem, end-user research and opinion-led interviews, and identifies potential obstacles.
- Ideate is the stage where end-user motivations and needs are identified and ideas are generated to meet these, perhaps through brainstorming.
- Prototyping sees the resolve or working-up of these ideas, which are presented for user-group and stakeholder review, prior to being presented to the client.

- **Selection sees the proposed solutions reviewed against the design brief**

K. J. Somaiya College of Engineering, Mumbai-77

- objective. Some solutions might be practical but may not be the best ones.
- **Implementation** sees design development and its final delivery to the client.
 - **Learning** helps designers improve their performance and, for this reason, designers should seek client and target audience feedback and determine if the solution met the goals of the brief.

Introduction to B2C application:

A **B2C (Business-to-Consumer)** application bridges businesses directly with end customers, offering a personalized and efficient shopping experience. In the retail and e-commerce sector, B2C apps play a crucial role in enabling users to browse products, compare prices, manage their carts, and make secure purchases seamlessly from their mobile devices.

The B2C application featured here represents a **Flipkart-style e-commerce platform**, allowing customers to:

- Explore and shop across multiple product categories such as electronics, fashion, groceries, and home essentials.
- Manage shopping carts, view offers, and place orders conveniently.
- Track deliveries and review order details.
- Maintain a personalized profile with saved addresses, payment options, and preferences.
- Receive real-time notifications for deals, offers, and order updates.

E-commerce B2C apps prioritize **customer engagement and convenience**, integrating secure payment gateways, easy navigation, and responsive design to ensure an enjoyable and trustworthy online shopping experience.

Design of B2C application's interface (coloured):

The interface design centers on **clarity, intuitiveness, and visual consistency**, ensuring customers can explore and purchase products with minimal effort. Each screen focuses on a distinct function of the shopping journey while maintaining a unified visual identity.

Key Design Elements:

K. J. Somaiya College of Engineering, Mumbai-77
(A Constituent College of Somaiya Vidyavihar University)

1. Home Screen:

- Displays a prominent search bar for quick product discovery.
- Showcases curated categories, trending offers, and recently viewed stores.
- Visual tiles and icons make navigation intuitive, highlighting key sections like Grocery, Electronics, and Deals of the Day.

2. All Categories Screen:

- Organizes products into well-defined categories using rounded, colorful icons for visual clarity.
- Includes a search bar and “More on Flipkart” section for extended exploration.
- The grid layout provides easy scanning and faster navigation.

3. My Cart Screen:

- Displays items added to the cart with detailed pricing, discounts, and delivery options.
- Includes “Extended Warranty” and “Remove” buttons for complete control over purchases.
- The empty cart view encourages engagement through personalized “Suggested for You” recommendations.

4. Profile Screen:

- Offers quick access to Orders, Wishlist, Coupons, and Help Center.
- Allows users to manage account settings like saved cards, addresses, and notification preferences.
- Clean layout and visual hierarchy ensure smooth accessibility to personal details.

5. Notification Screen:

- Lists all notifications, neatly divided into “All” and “Offers.”
- Uses banners and offer highlights for high visual engagement.

K. J. Somaiya College of Engineering, Mumbai-77
(A Constituent College of Somaiya Vidyavihar University)

- Keeps users informed of expiring coins, sales, and exclusive deals.

6. Bottom Navigation Bar:

- Persistent across all screens for consistent user experience.
- Icons for Home, Categories, Cart, Notifications, and Profile ensure seamless movement between key sections.
- Blue and white color palette aligns with brand identity, enhancing readability and visual balance.

Post Lab Descriptive Questions

1. Specify the role of design thinking principles.

Design Thinking is a user-centered approach that focuses on understanding user needs, redefining problems, and creating innovative solutions through iterative prototyping and testing.

In the context of B2C applications, design thinking ensures that the product not only functions correctly but also provides a meaningful and intuitive user experience.

Key Roles in Application Design:

Empathize: Understanding customer pain points — such as complex navigation or unclear product details — helps in designing interfaces that are simpler and more responsive.

Define: Translating user research into clear design goals ensures that every feature aligns with customer expectations.

Ideate: Encourages creative brainstorming to propose multiple design options (e.g., card layouts, icon sets, or color schemes).

Prototype: Building low-fidelity and high-fidelity mockups to visualize the app's flow and interactions.

Test: Gathering user feedback to refine usability and eliminate friction points.

In this Flipkart-style B2C design, design thinking helped create a visually engaging, fast, and easy-to-navigate interface that meets the everyday needs of online shoppers.

2. What are the different types of Design Directions? With an example, explain each of them.

K. J. Somaiya College of Engineering, Mumbai-77
(A Constituent College of Somaiya Vidyavihar University)

Design directions represent strategic approaches that guide how an interface looks, feels, and interacts with users. Each direction focuses on specific visual and emotional cues to achieve a desired brand perception.

a. Minimalist Design Direction

Focus: Simplicity, whitespace, and essential elements only.

Example: Apple's website or Google's search page—clean interfaces that prioritize content and usability.

Application Example: The Profile screen in this app, which uses clear typography and minimal icons for a clutter-free experience.

b. Flat Design Direction

Focus: Use of flat colors, simple icons, and two-dimensional elements.

Example: Microsoft's Metro UI and modern app dashboards.

Application Example: The Category screen, which employs bold, flat icons for each section to enhance visual clarity.

c. Skeuomorphic Design Direction

Focus: Mimics real-world objects for familiarity and relatability.

Example: Early iOS designs with realistic textures and shadows.

Application Example: Could be used in shopping cart visuals, where the cart icon closely resembles a real one to convey function instantly.

3. What do you understand by themes of thinking ?

Themes of Thinking refer to different cognitive approaches or mental models that guide how designers analyze problems and develop creative solutions. They help balance innovation with practicality in design.

Common Themes:

Analytical Thinking:

Involves logical problem-solving and breaking down complex systems into smaller parts.

Example: Analyzing user data to improve product placement in the Home screen.

Creative Thinking:

Encourages imagination and experimentation to produce novel solutions.

Example: Designing unique offer banners or interactive product displays to boost engagement.

Critical Thinking:

Challenges assumptions and validates design decisions through reasoning and feedback.

Example: Testing navigation flow to ensure it meets user expectations.

Reflective Thinking:

Involves reviewing past design choices and their outcomes to guide future improvements.

Example: Learning from user feedback about checkout delays to optimize the Cart experience.

Design Thinking (Integrative Theme):

Combines empathy, ideation, and experimentation — integrating creativity with user-centered functionality.
