

## 5.3 IMPLEMENTATION – Notes (SADT / Design Thinking)

Implementation = **final stage** of the design process.

This is where the approved design is **produced, completed, and delivered** to the client.

---

### ★ What is Implementation?

- The design is **realized physically** exactly as approved.
  - All earlier decisions (format, scale, materials, media) become real in production.
  - Not a production guide → but design thinking behind the physical creation.
  - Goal: **No surprises** for the client.
- 

### 1 Role of the Design Team

During implementation:

- Designers hand over work to:
    - Printers
    - Book binders
    - Programmers
    - Other specialists
  - The design team must **communicate clearly** so the final output matches expectations.
- 

### 2 Connection with Previous Stages

Implementation uses decisions made earlier:

- **Define stage** → requirements
  - **Ideation stage** → design choices
  - **Refinement & Prototyping** → improvements
  - **Changes** may occur because of:
    - Budget
    - Timeline
    - Format
    - Print run
- 

### 3 Key Aspects of Implementation

There are **five major implementation considerations**:

---

#### ✓ (1) Format

- First decision in implementation.
  - Format may include:
    - Size
    - Orientation
    - Layout style
  - Must support clarity, function, and purpose.
- 

#### ✓ (2) Materials

- Second major decision.
  - What materials will be used?
    - Paper
    - Card
    - Fabric
    - Metal
    - Plastic
  - Material choice affects durability, feel, cost, and usage.
- 

#### ✓ (3) Finishing

- How the material is completed:
    - Coating
    - Embossing
    - Engraving
    - Etching
    - Cutting
    - Painting
  - Finishing adds quality and professionalism.
- 

#### ✓ (4) Media

- Where will the design be displayed or delivered?
    - Print
    - Digital
    - Posters
    - Packaging
    - Websites
  - Different media require different formats, sizes, or colours.
- 

### ✓ (5) Scale

- Challenging assumptions about size can create striking designs.
- Designers consider:
  - Should the book be bigger/smaller?
  - Should the poster be huge for visibility?

Scale affects:

- Impact
  - Readability
  - Cost
- 

### Series and Continuity

Designers must check if:

- The design is a **one-time piece**, or
- Part of a **larger series** (e.g., brand kit, website pages, posters)

Consistency must be maintained across:

- Media
- Formats
- Colours
- Typography

A unified visual identity is important.

---

### **5** Glossary Use in Implementation

- Understanding design terminology avoids misunderstandings.

- Helps everyone:
  - Designers
  - Clients
  - Printers
  - Programmers

Example:

- “Research” → means thoroughly understanding the brief before starting.
- 

## Implementation in Software Context

When implementation refers to **software design**, it includes:

### ✓ Translating static and dynamic models into code

- Coding UI, logic, workflows
- Implementing system architecture

### ✓ Creating the database

- Based on the final schema
- Table creation, relationships, indexing

### ✓ Storing components

- Putting code, assets, libraries, and resources into correct locations

This is the “build the real product” stage in software development.

---

## QUICK REVISION SHEET (5.3 IMPLEMENTATION)

- Final stage: produce design physically
- Designers hand over to printers/programmers
- Must match what client approved
- Based on earlier design decisions
- Key aspects:
  1. Format
  2. Materials
  3. Finishing
  4. Media
  5. Scale

- Check for series/continuity
- Understand design vocabulary
- Software implementation → coding + database + component placement
